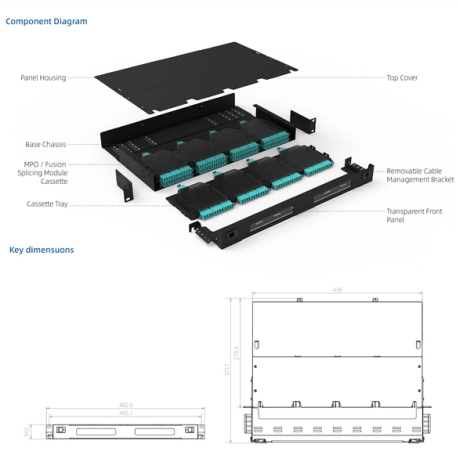
Austrian Low-Voltage Distribution Box Specifications and Models



AI Overview

Austrian low-voltage distribution boxes typically operate at 230/400 V, 3-phase 4-wire, with radial or branched radial topology, and are modeled using standardized electrical parameters for transformers, cables, and protective devices.Voltage and Network ConfigurationIn Austria, low-voltage (LV) distribution networks follow the European standard 230/400 V, 3-phase 4-wire system (IEC 60038) for residential and commercial supply . LV distribution boxes connect the output of medium-voltage/low-voltage (MV/LV) transformers to the local network via busbars and load-break switches or isolating links. The network is often arranged in radial or branched-radial circuits, allowing flexible isolation of sections for maintenance or fault management .Topology and Cable ParametersLV distribution boxes are part of a network where underground cables are common in urban areas, typically following street layouts. The boxes may include link boxes at street corners to interconnect distributors from neighboring substations, with neutral links maintained and phase links fused or omitted for safety . Cable parameters for modeling include:Conductor type and cross-section (commonly copper or aluminum, 16–240 mm^2 depending on load)Cable length and impedance (resistance and reactance per unit length)Thermal ratings for continuous currentShort-circuit ratings for protection coordination Topology identification for LV networks can be data-driven, using smart meter measurements and GIS data to reconstruct radial structures and estimate cable lengths and branch points .Transformer and Load ParametersLV distribution boxes are connected to MV/LV transformers, typically rated for 400/230 V output. Key model parameters include:Transformer rated power (kVA)Impedance voltage (%)Load connection type (delta or star)Short-circuit and no-load lossesVoltage regulation characteristics Load...
