

Cable trays available in meters

AI Overview

Standard cable tray lengths are typically 2.44 meters, 3 meters, and 3.66 meters, with widths ranging from 50 mm to 1000 mm depending on application. Standard Lengths Cable trays are generally manufactured in straight sections of 2.44 m, 3 m, or 3.66 m to simplify transport, installation, and structural planning, though custom lengths can often be requested for specific projects. These lengths are modular, allowing multiple sections to be joined to create continuous runs of any required distance. Widths and Depths Widths typically range from 50 mm to 1000 mm, with narrower trays (100–150 mm) used for instrumentation and control wiring, medium trays (300–600 mm) for general power distribution, and wide trays (>600 mm) for heavy industrial or data center applications. Depths (or side rail heights) usually range from 50 mm to 150 mm, providing sufficient vertical space for cable stacking while maintaining airflow and heat dissipation. Tray Types and Materials Cable trays come in various types, including ladder, perforated, channel, and wire mesh, each suited for different load capacities and ventilation needs. Common materials include aluminum, hot-dipped galvanized steel, pre-galvanized steel, and stainless steel (304 or 316L). Ventilated or solid-bottom options are available depending on project requirements. Practical Considerations Fill ratio: Trays are typically filled to 40–50% of their capacity to allow heat dissipation and future cable additions. Modularity: Sections can be connected using mechanical fittings, and shorter sections may be used in congested areas or where frequent direction changes occur. Custom lengths: Many manufacturers offer custom-cut sections to meet specific installation needs, though this may involve additional lead time. In summary, cable trays in metric systems are widely available in 2.44 m, 3 m, and 3.66 m lengths, with a variety of widths, depths, materials, and types to suit different electrical and industrial applications.
