

Can a 60-yuan optical module be used

Overview

Long-range modules are optimized for single-mode fiber. Q2: What is the difference between ZX and EX SFP modules?

A: ZX supports up to 80 km, uses 1550nm wavelength and offers higher output power. Because all the SFP optical modules support these monitoring functions, eSFP is also called SFP. SFP+: small form-factor pluggable plus, SFP with a. SFP (Small Form-factor Pluggable) modules are standardized network transceivers that support a range of data rates (1G, 10G, 25G) and fiber types. Long-distance variants, typically referred to as LX, EX, ZX, or ER/LR SFPs, are engineered with higher optical power budgets and longer wavelength. A myriad of compatible fiber optic transceivers is used in network deployments. However, there are still concerns about quality, interoperability, and compatibility issues when selecting optical modules. In today's crowded OEM-compatible transceiver market, it is important to choose wisely. Its primary function is to achieve optoelectronic conversion by converting electrical signals into optical signals and vice versa.
