

Distribution Box Brand Code Coding

AI Overview

Distribution boxes are identified using HS codes for trade, brand/model numbers for manufacturer identification, and barcodes/GTINs for inventory and retail tracking. HS Codes for Distribution Boxes Distribution boxes are classified under HSN/HS codes for international trade, which ensures proper customs clearance and duty calculation. The most commonly used HS code for distribution boxes is 85371000, which covers electrical distribution boards and panels. Multiple HS codes may exist depending on the type, voltage rating, and configuration of the distribution box. For example, some codes differentiate between PVC-embedded boxes, DIN rail-mounted boxes, or high-voltage panels. Brand and Model Coding Manufacturers assign brand and model numbers to distribution boxes to uniquely identify products. For instance, a distribution box may be labeled as Brand: BYD, Model: Chazor, or Brand: Supreme Lux, Model: V8, which helps in tracking specifications, warranty, and compatibility. These codes often include details about material, capacity, and intended application, such as magnetic steel with plastic cover or IP40-rated enclosures. Barcode and GTIN Identification For inventory and retail purposes, distribution boxes may also carry barcodes or GTINs. These include: UPC (GTIN-12) for North America EAN-13 or EAN-8 for Europe and other regions ITF-14 (GTIN-14) for multipacks or shipping boxes Barcodes encode the product's manufacturer, item number, and packaging level, allowing automated scanning, stock management, and traceability. Summary Distribution box coding involves a multi-layered system: HS Codes – for trade classification and customs. Brand/Model Numbers – for manufacturer identification and product specification. Barcodes/GTINs – for inventory, retail, and logistics tracking. Understanding these coding systems ensures accurate product identification, smooth import/export processes, and efficient inventory management.
