Overview

FW/1 - Framework One - is a family of small, lightweight, convention-over-configuration frameworks, primarily for CFML. What is a Distribution Box?

A distribution box, or DB box, is a circuit breaker enclosure. It is a vital part and central hub of any electrical system. The hub distributes electrical power from a single input source to various circuits throughout a building. Whether it's a home, office, or factory. A Box and Whisker Plot is also called as a Box Plot which is a graphical representation of a dataset based on its five-point summary. It displays the distribution of data using a rectangular box and two whiskers making it easy to understand the spread, central tendency and presence of extreme. This FW/1 directory is a complete web application and expects to live in its own webroot if you plan to run the applications within it. To use FW/1 in a separate webroot you can either copy the framework directory to that webroot or add a mapping for /framework to the framework folder inside this. A distribution board (also known as panelboard, circuit breaker panel, breaker panel, circuit breaker, electric panel, fuse box or DB box) is a component of an electricity supply system that divides an electrical power feed into subsidiary circuits while providing a protective fuse or circuit. Distribution boards, often referred to as electrical panels or breaker boxes, serve as the nerve center of any electrical system. High-quality materials and robust product designs ensure a reliable connection, signal transmission and power.
