

Dual-mode fiber optic single-mode home

Overview

Single fiber modules (BiDi) use one fiber for both transmitting and receiving data. Fiber media converters quietly solve a big, practical problem: they bridge copper Ethernet to fiber and extend links far beyond copper's reach. In real networks such as campuses, factories, metro POPs converters let you reuse existing switches and still run fiber for long distance, EMI immunity. There are two main types of fiber optic cables: single mode and multimode. Although they can do the same job in some instances, the different construction methods make each of them better suited to certain tasks and budgets. Let's break down these terms in simple, clear language with practical examples. How do we choose, and what are their differences and advantages?

Let's learn about this! What is a Single-Fiber (BiDi) Transceiver?

Single fiber module also called BiDi transceiver or WDM module.
