

How to set up a mobile fiber optic connection to a TP-Link router

At Overview

You can set up your TP-Link router with fiber optic internet by connecting it to your ONT, configuring the WAN settings, and securing your Wi-Fi network using either a web browser or the TP-Link Tether app.

Step 1: Connect Your Router to the Fiber Internet Most fiber optic connections terminate at an Optical Network Terminal (ONT) provided by your ISP. Plug an Ethernet cable from the ONT's LAN port into the WAN port of your TP-Link router. This allows the router to receive the internet signal from the fiber line.

Step 2: Power On and Connect Plug in your TP-Link router using the supplied AC adapter. Connect your mobile device or computer to the router's default Wi-Fi network. The network name (SSID) and password are usually printed on a sticker on the router.

Step 3: Access the Router Configuration You can configure the router using either a web browser or the TP-Link Tether app:

- Web browser method:** Open a browser and enter or 192.168.0.1. Log in with the default username and password (usually admin/admin).
- Tether app method:** Download the TP-Link Tether app, select your router, and follow the on-screen instructions to connect and configure it.

Step 4: Configure Internet Settings In the router interface, go to the WAN/Internet settings. Select the connection type required by your ISP (commonly PPPoE for fiber). Enter the username and password provided by your ISP. If your ISP's device is a combo modem/router, you may need to enable bridge mode on the ISP device so your TP-Link router handles all routing and Wi-Fi duties.

Step 5: Set Up Wi-Fi and Security Navigate to Wireless Settings to configure your SSID (network name) and password. Choose a strong, unique password. In Security Settings, select WPA2 or WPA3 encryption for optimal protection.

Step 6: Configure LAN and Additional Settings Optionally, adjust the LAN IP address and subnet mask to fit your network r...
