

How to set up a router using PPPoE fiber optic internet

AI Overview

To set up a router for PPPoE fiber optic internet, access the router's admin panel, select PPPoE as the WAN connection type, and enter your ISP-provided username and password.

Step-by-Step Setup

Gather ISP Information Before starting, ensure you have your PPPoE username and password from your internet service provider. Some ISPs may also provide a service name or require a VLAN ID, though most do not.

Connect Your Router Plug the fiber optic modem or ONT (Optical Network Terminal) into the router's WAN port using an Ethernet cable.

Power on both devices.

Access the Router Admin Panel Open a web browser and enter the router's IP address (commonly 192.168.1.1 or 192.168.0.1). Log in using the default admin credentials (usually printed on the router or in the manual).

Select PPPoE as the Connection Type Navigate to WAN or Internet Settings. Choose PPPoE as the connection type.

Enter ISP Credentials Input your username and password exactly as provided by your ISP. If your ISP requires a VLAN ID, enter it; otherwise, leave it blank.

Optional Settings You can configure a custom DNS server or MAC address cloning if your ISP requires it. Some routers allow you to set PPPoE session persistence, which automatically reconnects after brief outages.

Save and Reboot Save the settings and restart the router. If the connection fails, reboot both the modem/ONT and router, then retry.

Verify Connection Check the router's status page to confirm the PPPoE connection is active. Test internet access on a connected device.

Router-Specific Notes

TP-Link Wi-Fi 6 Routers: Use the Quick Setup wizard, select PPPoE, enter credentials, and optionally select your ISP profile if available.

Other Brands (Asus, Netgear, Tenda): The process is similar—access WAN settings, select PPPoE, enter credentials, and save. Following these steps ensures your fiber optic internet connection via PPPoE is properly config...
