

Impact of surges on relay protection

Overview

Surge protection for relays prevents electrical damage from voltage spikes that can destroy sensitive components and cause system failures. However, various factors, both natural and man-made, can cause momentary surges in voltage, known as power system surges. Consider a transmission line between two generating stations. The current flowing through. Abstract: Electrical power system surges represent a significant challenge in both residential and industrial settings, affecting the reliability and safety of electrical networks. To ensure long-term. Open/close surge is a transient high voltage surge induced in a switch or relay during its on and off operation, particularly when turning off, which causes rapid current change and inductance of the circuit or wiring.
