

Is it permissible to construct underground fiber optic cables above ground

Overview

Regulatory and Permitting Issues: Installing fiber optic cables above ground may require obtaining permits from local authorities, especially when using public or shared infrastructure like utility poles. Exposing cables beyond their design specifications leads to failure. 5-foot sag for a 150-foot span helps cables handle thermal. Deploying fiber above ground on poles or towers removes the need for underground digging and is particularly useful when the ground is uneven, rocky or both. Aerial installation is generally much less costly than underground construction also. Network management personnel should also provide timely drawings of underground pipe network if further construction is. Aerial fiber, consisting of fiber optic cables installed above ground, usually attached to existing utility poles or other structures, are typically suited to the following applications and environments: Cost-Effective: Installation is generally 30-50% less expensive upfront compared to underground.
