

Mauritius Cable Tray Inorganic Sealing Material

AI Overview

Inorganic sealing materials for cable trays in Mauritius typically include fire-resistant mortars, cementitious compounds, and mineral-based sealants designed to protect cables from fire, moisture, and corrosion. Overview Inorganic sealing materials are used to seal cable tray penetrations, joints, and openings to prevent fire spread, water ingress, and chemical damage. Unlike organic sealants, these materials are non-combustible, heat-resistant, and chemically stable, making them ideal for industrial and infrastructure projects in Mauritius, where humid and coastal conditions can accelerate corrosion and material degradation. Common Types Cementitious Firestop Compounds Made from Portland cement mixed with additives for adhesion and thermal stability. Provide fire resistance up to 4 hours, suitable for cable tray penetrations through walls or floors. Resistant to moisture and salt-laden air, which is critical in coastal Mauritius. Mineral Wool-Based Sealants Composed of mineral fibers combined with inorganic binders. Offer excellent thermal insulation and fire-stopping properties. Can be used in combination with intumescent coatings for enhanced fire protection. Hydraulic or Gypsum-Based Mortars Quick-setting, non-combustible, and suitable for filling gaps around cable trays. Provide mechanical stability and prevent dust or water ingress. Selection Considerations for Mauritius Corrosion Resistance: Choose sealants compatible with hot-dip galvanized or stainless steel trays, which are preferred in Mauritius for coastal durability. Fire Rating Compliance: Ensure materials meet BS 476, IEC 61537, or local Mauritian electrical codes for fire safety. Environmental Durability: Materials must withstand high humidity, salt spray, and temperature fluctuations common in Mauritius. Ease of Application: Pre-mixed or pumpable inorganic sealants can reduc...
