

Optical module DOA failure

Overview

The Problem: The laser diode (Tx) or photodetector (Rx) within the module can degrade over time or fail prematurely. Causes include manufacturing defects, excessive operating temperature, voltage spikes, or simply reaching end-of-life. DOA failures in electronics pose a strategic risk to companies that supply sensitive, expensive, or mission-critical components within complex supply chains. In high-tech, medical technology, defense, and industrial manufacturing, electronic failures upon arrival can result from shocks, vibrations. Optical modules (SFP, SFP+, QSFP, QSFP28, etc.) are designed for high reliability in modern networks. Symptoms: Gradual increase in Bit Error Rate (BER), reduced. However, common causes of optical module failures, such as ESD (electrostatic discharge), port contamination, environmental stress, compatibility issues, and device aging, can lead to performance degradation and even link interruptions.
