

The KVM switcher is no longer working

AI Overview

A KVM switch that is unresponsive is often caused by power issues, faulty cables, or device compatibility problems, and can usually be resolved by systematically checking connections, power supply, and input/output devices.

Step 1: Check Power Supply Ensure the KVM switch is properly connected to a power source and that any power switch is turned on. If the indicator lights are off or there is no response, try replacing the power adapter with a compatible 12V DC center-positive adapter, as a faulty power brick is a common cause of failure. Unplug the KVM for several minutes before reconnecting only the power to see if it responds with a light or click.

Step 2: Verify Cable Connections Check all cables connecting the KVM switch to your computers and monitors. Ensure they are securely plugged in and functioning. If the display shows “no signal,” try connecting the monitor directly to the host computer to confirm the cable works. Using high-quality cables and adjusting the output resolution to 720p or 1080p can resolve compatibility issues.

Step 3: Test USB Peripherals If the KVM switch powers on but USB devices are not recognized, ensure the devices are connected to the correct ports. Some KVM switches have separate HID or USB 2.0/3.0 ports; connecting keyboards and mice to the designated HID ports can restore functionality. Windows 10 PCs may have issues recognizing USB 3.0 devices after toggling the switch, so testing with a USB 2.0 hub or different port may help.

Step 4: Reset and Reboot Power cycle the KVM switch by unplugging all cables and the power supply, then reconnecting them one at a time. Rebooting the connected computers can also help the switch reinitialize properly.

Step 5: Check Hotkeys and Keyboard Indicators If hotkeys are not working, ensure the keyboard is connected to the correct port and that features like N-key rollover (NKRO) are compatible with the KVM switch. Some switches require the keyboard to be plugged directly into the front HID port for hotkey functionality.
