

The monitor's light sensor module is slow to respond

Overview

Gently press bright lines to see displacement, replace screen if broken line. Use multimeter to measure voltage, logic analyzer to check signals, prioritize eliminating contact and power supply issues. I'm trying to get ambient light sensor readings on my Framework 13" 12th gen. Arch wiki says it should work out of the box with iio-sensor-proxy, so I enabled hardware. monitor-sensor doesn't seem to work though, when I run it it gets stuck here: Waiting for. My computer can see the bluetooth module, but when I try to connect to it, it only works for a couple seconds before disconnecting and then I can't reconnect. LEDs gradually lose brightness after thousands of hours of operation, with typical lifespans between 30,000 and 100,000 hours, leading to dim screens and reduced contrast.
