

Zimbabwe router fiber optic cable turns red

AI Overview

A red LOS (Loss of Signal) light on your fiber optic router indicates that your router has lost connection to your Internet Service Provider (ISP), often due to cable issues, service outages, or hardware problems.

Common Causes

Fiber Optic Cable Damage: Physical cuts, bends, or kinks in the fiber optic cable can disrupt the signal, causing the LOS light to turn red.

Service Outage: ISP maintenance, technical issues, or local network outages can interrupt your connection.

Loose or Faulty Connections: Improperly connected cables or damaged connectors between the router, ONT, or wall outlet can trigger the red light.

Router or ONT Malfunction: Hardware issues, firmware errors, or overheating may prevent the router from communicating with the ISP.

Power Fluctuations: Unstable power supply or faulty surge protectors can affect router performance.

Troubleshooting Steps

Check for ISP Outages: Visit your ISP's website or social media pages to confirm if there is a known service disruption in your area.

Inspect the Fiber Cable: Look for visible damage, ensure the cable is properly connected to the WAN/ONT port, and avoid sharp bends.

Reboot the Router: Turn off the router, unplug it from the power source for 30–60 seconds, then reconnect and power it on. This often resolves temporary signal issues.

Secure Connections: Check all cables, including power, LAN, and fiber optic connections, and tighten any loose connectors.

Check Router Settings and Firmware: Log into the router's admin panel to verify WAN settings and update firmware if needed.

Contact Your ISP: If the red light persists after these steps, your ISP may need to inspect the line or replace faulty equipment.

Additional Tips

Avoid bending or stretching the fiber optic cable excessively. Keep the router in a well-ventilated area to prevent overheating. Use a stable power source or surge protector to prevent power-related disruptions. By foll...
